Abstract:

PROBLEM TO BE SOLVED: To call a destination party connected even by the protocol PPP and to make a speech in the case of an internet telephone system that makes communication through the use of the internet being a computer network.

SOLUTION: The system is made up of a computer network, terminal equipments of the computer network are interconnected via a server S1, and data including at least voice data are transferred in the computer network. The server S1 is provided with a database DB1 in which call information for the connection to destinations is stored. When a caller terminal equipment T1 makes a call to an opposite party terminal equipment T2, the server S1 of the computer network uses the database DB1 to retrieve a connection destination of the opposite party terminal equipment T2. Then the opposite connection destination is called to connect the server S1 of the computer network to the opposite party terminal equipment T2. Thus, for an opposite party using the point to point protocol (PPP) for the connection, the caller terminal equipment makes a call to the opposite party and makes communication.
